

The new default values from the MAF look-up table are as follows. The 'Stocks' column is the total accumulated sequestered carbon, and 'Credits' is the annual change showing units the landowner is eligible for:

Revised MAF look-up table for carbon sequestration in post 1989 indigenous forests

Both total accumulated Stocks and annual sequestration (Credits) are shown

Establishment Year	Forest Age	Stocks (t/ha)	Credits (t/ha)
2011	1	0.6	0.6
2010	2	1.2	0.6
2009	3	2.5	1.3
2008	4	4.6	2.1
2007	5	7.8	3.2
2006	6	12.1	4.3
2005	7	17.5	5.4
2004	8	24.0	6.5
2003	9	31.6	7.6
2002	10	40.2	8.6
2001	11	49.8	9.6
2000	12	60.3	10.5
1999	13	71.5	11.2
1998	14	83.3	11.8
1997	15	95.5	12.2
1996	16	108.1	12.6
1995	17	120.8	12.7
1994	18	133.6	12.8
1993	19	146.3	12.7
1992	20	158.7	12.4

1991	21	170.9	12.2
1990	22	182.6	11.7
	23	193.9	11.3
Pre-1990 forest is ineligible for carbon credits	24	204.7	10.8
	25	215.0	10.3
	26	224.6	9.6
	27	233.7	9.1
	28	242.2	8.5
	29	250.1	7.9
	30	257.5	7.4
	31	264.3	6.8
	32	270.6	6.3
	33	276.3	5.7
	34	281.6	5.3
	35	286.5	4.9
	36	290.9	4.4
	37	295.0	4.1
	38	298.7	3.7
	39	302.0	3.3
	40	305.1	3.1
	41	307.8	2.7
	42	310.4	2.6
	43	312.6	2.2
	44	314.7	2.1
	45	316.5	1.8
	46	318.2	1.7

	47	319.7	1.5
	48	321.1	1.4
	49	322.3	1.2
	50	323.4	1.1

Please note that it is possible for the rate of sequestration given in the table to be higher than the actual rate of carbon sequestration in many indigenous forests. As a result a landowner may receive more AAUs in a particular period than would reflect the level of carbon that their forest is actually sequestering. For sites over a minimum size (initial indications are 100 ha) a potential future liability may therefore exist and landowners would have to repay units following a compulsory measurement. If your Forest Sink Area is less than 100 ha it is expected that you will be able to use the default look-up table without needing a measurement.
